

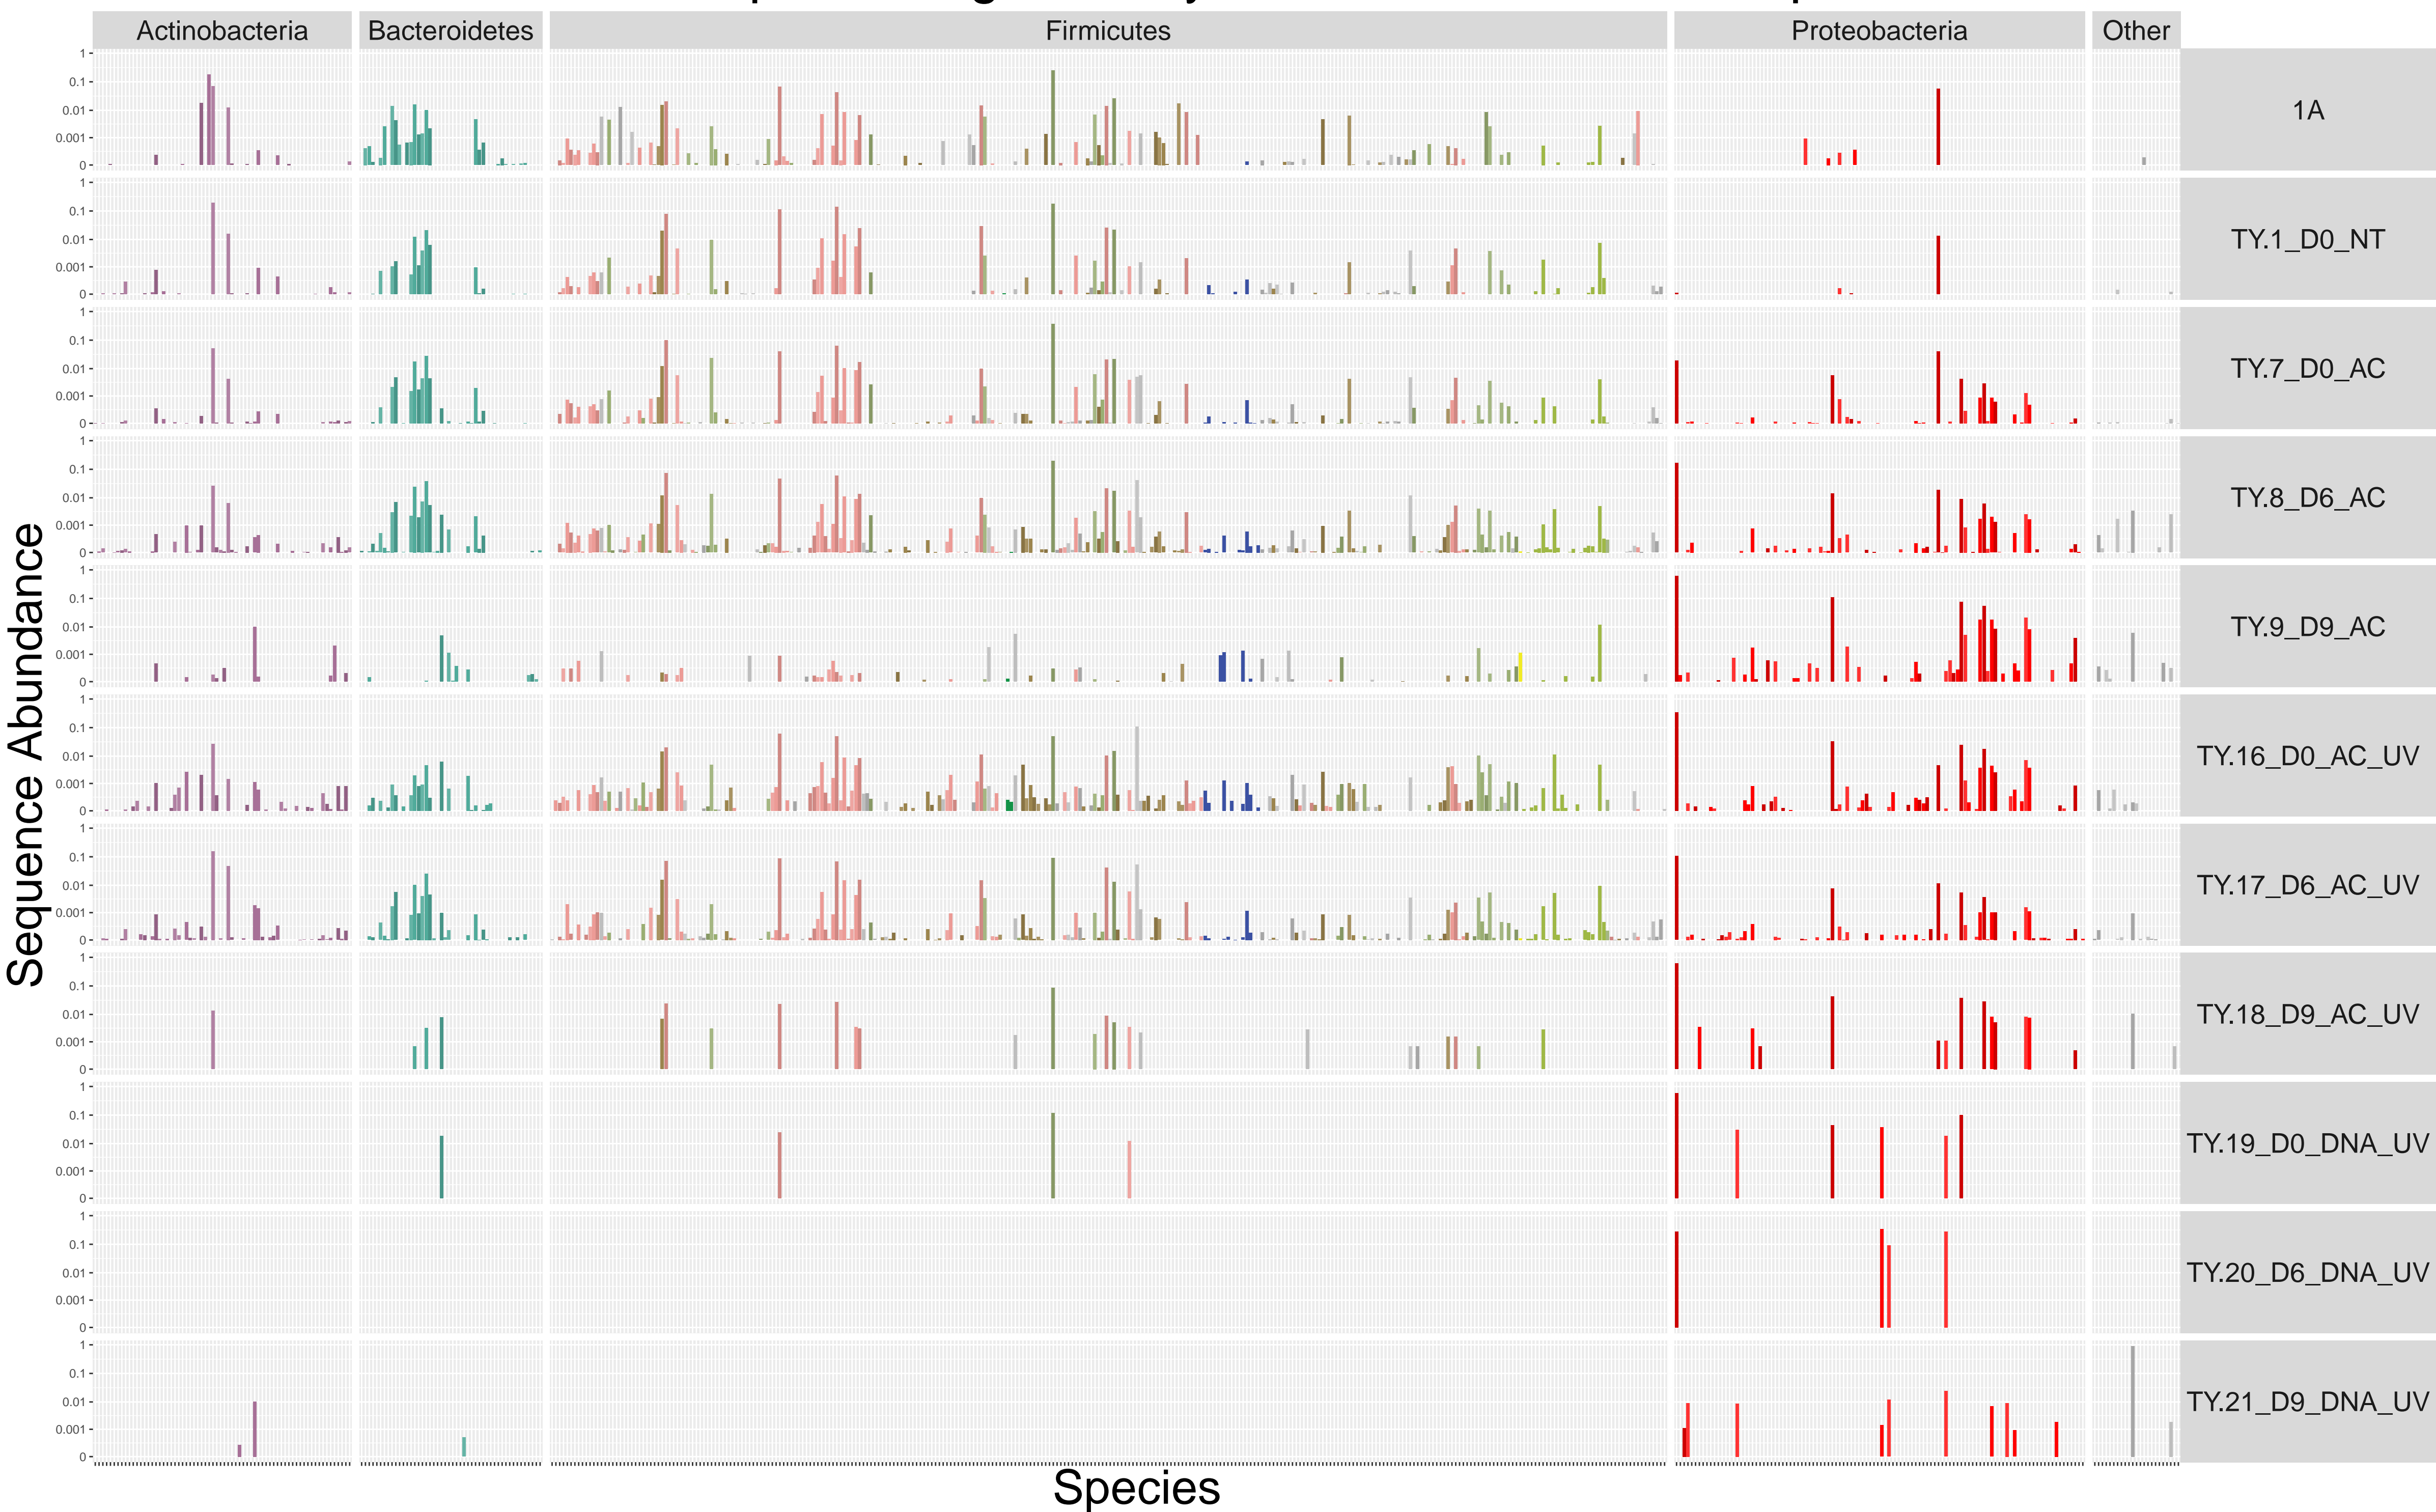

Figure 7. Bacterial Species Composition of Controls and Samples in Significantly Altered Treatment Groups

Bar plot depicts relative abundance of all observed bacteria species in select samples; each row represents a single collected sample. Bar color denotes selected group. Species are listed on the x-axis and grouped by phylum (top facet). Treatments are noted in the sample name (right facet), and the first two rows are controls. Aside from the controls, only samples that exhibited significant compositional change were included (belonging to autoclave and UV exposure after DNA extraction treatment groups)
